

## INFORMATION FOR PATIENTS AND FAMILIES

# Diagnosed with intimal sarcoma?

Intimal sarcoma is an ultra-rare cancer of the pulmonary artery, the heart or the aorta. Most oncologists never see a case, and reliable information is hard to find. This page points to a place where it has been collected in plain language.

In a pooled analysis of 643 published cases of pulmonary artery sarcoma, about seven in ten patients were first diagnosed with a blood clot in the lung before the tumour was recognised.

Kashizaki F et al., Archivos de Bronconeumologia 2025; doi:10.1016/j.arbres.2024.12.012

## What you find at intimasarc.com

- **A patient guide with sources**

What the diagnosis means, prognosis, treatment options, how to read your pathology and molecular report, and questions for your next appointment.

- **What has been tried at recurrence**

The published evidence, with the number of patients behind every statement.

- **Trial alert by e-mail**

A short message when a trial for MDM2/CDK4-amplified tumours opens, changes or reports.

- **Contact with other patients**

Every message is answered by a patient. A small international patient group exists.
